

Image aspect ratios by page and section

Crop ratios describe the **visible frame on the public site** (CSS aspect-*, fixed box, or viewport cover with object-cover) — **not** the source file dimensions an editor uploads. Admin ImageFields generally do not show these hints yet; crops are enforced in the frontend.

Legend

- Ratios are **W:H of the on-page crop** visitors see.
- Prefer Tailwind aspect-* when the layout sets one (e.g. aspect-video = **16:9**, aspect-square = **1:1**).
- **Viewport cover** = height/width from svh/vh (or section height) + object-cover. Visible ratio follows the device; document typical desktop vs mobile when they differ.
- **Layout box** = height/width from flex/grid/content (no fixed aspect-*). Approximate only.
